Frustration Report Week 3

Challenges Faced

During week 3 our task was to upload the tables into SQLite and create a database. My biggest challenge was understanding how to download SQLite onto my computer. I had a difficult time with this and felt like it was more complicated since I was using a Mac to complete this task. I also attempted to use other SQL platforms to try and get the results we were looking for. However, I was unsure if this was the correct approach since the instructions asked to use SQLite. I feel like the main problem was that I have minimal knowledge on using SQL aside from using Microsoft Access during our first year of the BANA program.

Strategies

Some strategies I used was to research online and find external resources on how to properly use SQLite. Figuring out the best approach to installing SQLite onto my computer was a challenge at first. However, once it was installed, navigating through it and working through the challenges was simplified.

Reflections

I feel like this week was definitely a challenge given the minimal knowledge I have on SQL. I would definitely like to spend extra time on understanding SQLite better and get more familiar and comfortable using SQL in general. I feel like this is a skill that I need more practice with. I felt like this week gave me a better understanding on how to navigate difficult challenges. It also helped me understand that I need to spend more time working through the week's tasks to fully understand the best approach before getting started.
